; @mislove2017multi; @admoni2018optimizing]. Conclusion ===== This paper defined a multiplex-attentive energy-aware routing problem. It is a non-trivial problem that cannot be solved in polynomial time. We first constructed the corresponding LP relaxation. Then, we developed approximation algorithms that are polynomial for a wide range of practical values. The influence of sand mining on groundwater in the Kruger National Park: an empirical study. Sand mining for the production of cement has increased in South Africa over the last 15 years. Due to the extraction of sand from the Kalahari sands, the overlying aquifers are being depleted at an unsustainable rate. The hydrological response of the aquifers to sand extraction was investigated to determine the most appropriate response strategies to this phenomenon. A 2-year monitoring of rainfall and groundwater levels was carried out in the Kruger National Park, South Africa. For the purpose of comparison, a similar study was carried out in a nearby area without mining. The results suggest that in the area with mining, groundwater levels are not falling over a two-year period. This has led to the conclusion that deep sand extraction is not an appropriate

response strategy to overlying groundwater depletion. Alternative strategies were suggested and are discussed in the paper.
